

---

Paragraphs contain text and may contain inline markup: *emphasis*, **strong emphasis**, inline literals, standalone hyperlinks (<http://www.python.org>), external hyperlinks ([Python](#)), internal cross-references (*example*), external hyperlinks with embedded URIs ([Python web site](#)), footnote references (manually numbered<sup>1</sup>, anonymous auto-numbered<sup>2</sup>, labeled auto-numbered<sup>3</sup>, or symbolic<sup>4</sup>), and substitution references (). Character-level inline markup is also possible (although exceedingly ugly!) in *reStructuredText*. Problems are indicated by |problematic| text (generated by processing errors; this one is intentional).

The default role for interpreted text is *Title Reference*. Here are some explicit interpreted text roles: a PEP reference ([PEP 287](#)); an RFC reference ([RFC 2822](#)); a subscript; a superscript; and explicit roles for *standard inline* markup.

- A bullet list

1 A footnote contains body elements, consistently indented by at least 3 spaces.

2 This footnote is numbered automatically and anonymously using a label of "#" only.

3 Footnotes may be numbered, either manually (as in '1') or automatically using a "#"-prefixed label.

4 Footnotes may also use symbols, specified with a "\*" label.
